1. Introduction

The application frame includes all applications of Sentech Instruments. The purpose of the application frame is to start the components and to run the background program SiALoad.exe, as well as switching between the different components, menus and toolbars. Fig. 1-1 shows a schematic overview of the application frame structure.

As visible in the figure the application frame works as environment for the components, which communicate via XML-Interface. There are 2 different kinds of components, first group is the “subscribers” (for example: the mapping program or SpectraRay 3) and the second group is the “measurement tool drivers” (for example: FTPAdv). The “subscribers” are using the services of the different measurement tools therefore they are sending operation commands including the chosen settings via interface to the measurement tools. These commands are received and executed by the programs. The result with a specific data volume which depends on the settings for the recipes is sent back.

The task of the “subscribers” is to collect all measurement data while the measurement tools collect the data at the specific measuring point. The application frame also manages the users and assigning the user rights. While different users may operate with the device this is useful because the rights can limit their access on changing specific settings or executing functions. In this way the number of damages caused by failures or incorrect measurements can be minimized.
2. Operating with the Application Frame

2.1 Starting the Software

The user software can be executed by clicking the Symbol from Fig.2-1 on your desktop. In addition, the software can be started via Windows Explorer. The default installation path is 'C:\Sentech\ApplicationFrame\SiAFram.exe' but may also have been changed by the administrator during the installation.

![Fig. 2-1: Starting symbol of the application frame](image)

2.2 User authorisation

![Fig. 2-2: Login window](image)

To take advantage of the software a valid username and password have to be submitted after starting. The master password and the related user name can be found in the file “password.txt”, the path is “password” on the delivered CD-ROM.
2.3 Appearance of the application frame

The main window can be seen in Fig. 2-3. It consists of the following visible details:

- Title- und system menu
- Main menu
- Toolbar
- Main window frame

The different items in the main window can be used or changed with the common windows commands. The visible buttons and menu entries can be accessed with help of the mouse or keyboard shortcuts. To use the shortcut press “Alt” + the underlined letter (for example: “<Alt>+M” measure sample or “<Alt>+F” for file menu).

2.4 Menus

2.4.1 Title- and system menu

The main window has a product specific title including a version number, e.g. “SENReserach 1.21” and shows also the current active task. The application frame is the standard software basis. Integrating different kinds of measurement tools into a standard software construct has several internal and external advantages, for example: standard data libraries, calculation routines and a familiar user interface for the users.

The symbol in the upper left corner can be clicked to access the system menu, including options for minimizing or closing the window.
Fig. 2-4 shows the system menu in the upper right corner of the application frame. This may also be used to minimize, close or restore the window. To close the window the data menu “File\Exit” or the keyboard shortcut “<Alt>+F4” are also available options.

![Fig. 2-4: System menu of the application frame](image)

Once the application frame has been started and is running the symbol in Fig. 2-5 will be visible in the windows taskbar. Click on the symbol to restore the window.

![Fig. 2-5: Symbol in the windows taskbar (example: SENDURO®)](image)

### 2.4.2 Main menu

The main menu provides access to various functions of the application frame and the active components.

![Fig. 2-6: main menu (example SENDURO®)](image)

The menu entries 'File', 'View', 'Logon', 'Window' und 'Help' belong to the application frame the other entries visible in Fig. 2-6 depend on the active measurement tool driver and subscriber.

#### 2.4.2.1 Data menu

![Fig. 2-7: Data menu (example SENDURO®)](image)

The data menu provides the possibility to load and save experiments or applications. In addition print settings and previews can be created here. Depending on your active components additional options like saving spectres or export data may occur.
2.4.2.2. View menu

The view menu ('View') allows configuring the display of the several components in the main frame of the window. The status bar, the navigation tree and the toolbar may be set to be visible or hidden. With default settings only status bar and toolbar will be visible, the rest is hidden and has to be activated. Fig. 2-9 shows the default view.

Switching to full screen mode is possibly and can be ended by pressing the <Esc> button on the keyboard.

The other options in Fig. 2-8 are provided by the active component. A specific documentation can be found in the user manual of device. The menu also provides...
access to the available measurement tool drivers (for example: SENDURO) and an offline version of the SENTECH homepage.

2.4.2.3. The logon-Menu

This menu provides access to change the active user and enter the user administration window.

2.4.2.4. User administration

In this window all user access rights may be set up. It is possible to add, delete or edit the users. Specific settings can be assigned for every user or user group. Though this may only be changed by administrators.
**Editing users**

Fig. 2-12 displays the user frame. This frame shows all existing users. With the help of the button `New`, additional user accounts can be created.

![Create new user dialog box](image)

**Fig. 2-13: create new users**

With the help of the button `Delete`, user accounts can be deleted.

![User management dialog box](image)

**Fig. 2-14: Deleting a current user**

Existing accounts can be modified with the help of the button `Settings`.

![User settings dialog box](image)

**Fig. 2-15: modify existing user**
Assigning user rights

Fig. 2-16: user rights frame

Fig. 2-16 shows the user rights frame. In this frame specific rights can be assigned to existing user accounts. Therefore the respective user account has to be selected in the upper user frame. The assigned user rights are displayed in the checkboxes of the bottom frame. Specific rights may be granted or denied by checking the boxes. All rights belong to a certain category and can therefore be granted within one step. To do this choose the access-category as shown in Fig.2-17 and click the button  Add predefined rights.

Now all rights for the user category have been granted to the user account.

By clicking  Apply all changes that have been made will be applied. Changes will also be applied if the modified user is currently logged in.

- Login protocol file: if selected, a protocol file is written for all login/logoff events
- Enable auto login: if selected, no login dialog will be displayed; instead last (administrative) user will be login automatically (only for test purposes)

2.4.2.5. “window” menu
The different windows on the display can be arranged with the help of the window menu. Therefore the functions “cascade”, “tile\horizontal”, “tile\vertical” and “arrange icons” can be used. At the bottom of the sub menu table open windows are displayed and may be chosen so that they are in front.

2.4.2.6. Help menu
The help menu displays the current version ID of the application frame.
2.5 **Toolbar**

The Toolbar provides quick access on the most common functions with the help of self-explanatory symbols.

Fig. 2-19 displays the SENDURO toolbar. The functions may vary with different devices and depend of the frame in the front.

![Toolbar with most common functions](example SENDURO®)

Mouse-over information is provided when resting above the symbol with the mouse.

2.6 **Navigation tree**

The navigation tree on the left side provides the possibility to switch between the available windows. The button website will display an offline copy of the SENTECH homepage. Depending on the device, different specific options may occur.

For example the SENDURO provides the button “SENDURO:SENDURO” which will lead to the display of the SENDURO measurement tool driver. The navigation tree will not be displayed with the default options and therefore has to be activated in the view menu.

2.7 **Main window of the application frame**

In the main window of the application frame the opened windows will be displayed depending on the settings of the view menu. This might be subscribers and measurement tool drivers. Depending on the device and the installed hard- and software the appearance of the main window may vary. The following figures will schematically display different appearances of the main window in specific devices.

Fig. 2-20 shows the main window of the SENDURO which primarily consists of the SENDURO measurement tool driver.
Alternatively to the upper appearance several measurement tool drivers and a subscriber may be arranged within the window. This might be advantageous when for example the measurement tool driver has to be visible while mapping to simultaneously verify or change the settings for the measuring points. Fig. 2-21 shows the main window of the SE500advanced with mapping option. Within the window the driver for the SE400 and the FTPadv are visible. In addition the window for the camera in the autocollimation scope for adjustment and installation and the mapping software are combined in the application frame. In case of specific measurements which don’t require certain components can simply be deactivated with the help of the window menu.
Fig. 2-21: Application frame of the SE500advanced
